Atlas of Wood, Bark and Pith Anatomy of Eastern Mediterranean Trees and Shrubs Alan Crivellaro, Fritz Hans Schweingruber. 2016-10-04 This atlas presents anatomical descriptions of the xylem, bark and pith of 264 species belonging to 71 families. It highlights the anatomical diversity of trees, shrubs, dwarf shrubs, woody lianas and several of the prominent perennial herbs from the Eastern Mediterranean region, with a focus on the island of Cyprus. The island's topography and biogeographic history combine to provide a wide range of habitats and diverse flora including widespread, endemic, and ornamental species. The monograph for each species includes a description of the anatomical structures of the stem and twig xylem and the twig's bark and pith, as well as color micrographs of double-stained sections of each of these plant parts. These entries are accompanied by a photograph and a brief description of the plant including stem wood density, height, habit, flower, leaf and fruit characteristics, and a map showing its geographic and altitudinal distribution in the region. Xylem descriptions follow the IAWA lists of microscopic features for hardwood and softwood identification. For bark and pith descriptions, a new coding system developed by the authors is applied. Lastly, the work offers a key for wood identification that was developed to differentiate between groups of species by using a small number of features that are unambiguous and clearly visible. The atlas will be a valuable guide for botanists, ecologists, foresters, archeologists, horticulturists and paleobotanists.

Handbook of Wood Chemistry and Wood Composites, Second Edition Roger M.

Rowell. 2012-09-06 Wood has played a major role throughout human history. Strong and versatile, the earliest humans used wood to make shelters, cook food, construct tools, build boats, and make weapons. Recently, scientists, politicians, and economists have renewed their interest in wood because of its unique properties, aesthetics, availability, abundance, and perhaps most important of all, its renewability. However, wood will not reach its highest use potential until we fully describe it, understand the mechanisms that control its performance properties, and, finally, are able to manipulate those properties to give us the desired performance we seek. The *Handbook of Wood*

Chemistry and Wood Composites analyzes the chemical composition and physical properties of wood cellulose and its response to natural processes of degradation. It describes safe and effective chemical modifications to strengthen wood against biological, chemical, and mechanical degradation without using toxic, leachable, or corrosive chemicals. Expert researchers provide insightful analyses of the types of chemical modifications applied to polymer cell walls in wood. They emphasize the mechanisms of reaction involved and resulting changes in performance properties including modifications that increase water repellency, fire retardancy, and resistance to ultraviolet light, heat, moisture, mold, and other biological organisms. The text also explores modifications that increase mechanical strength, such as lumen fill, monomer polymer penetration, and plasticization. The Handbook of Wood Chemistry and Wood Composites concludes with the latest applications, such as adhesives, geotextiles, and sorbents, and future trends in the use of wood-based composites in terms of sustainable agriculture, biodegradability and recycling, and economics. Incorporating decades of teaching experience, the editor of this handbook is well-attuned to educational demands as well as industry standards and research trends.

Old-Growth Forests Christian Wirth, Gerd Gleixner, Martin Heimann. 2009-07-07 Many terms often used to describe old-growth forests imply that these forests are less vigorous, less productive and less stable than younger forests. But research in the last two decades has yielded results that challenge the view of old-growth forests being in decline. Given the importance of forests in battling climate change and the fact that old-growth forests are shrinking at a rate of 0.5% per year, these new results have come not a moment too soon. This book is the first ever to focus on the ecosystem functioning of old-growth forests. It is an exhaustive compendium of information that contains original work conducted by the authors. In addition, it is truly global in scope as it studies boreal forests in Canada, temperate old-growth forests in Europe and the Americas, and global tropical forests. Written in part to affect future policy, this eminently readable book is as useful for the scientist and student as it is for the politician and politically-interested layman.

Wood in Archaeology Lee A. Newsom. 2022-01-20 In this book, Lee A. Newsom offers an overview of wood in archaeology --how and where it is preserved and analyzed, its relevance to paleoecological and paleoenvironmental questions, as well as its role as an important source of information in modern archaeological science and related historical disciplines. Her book addresses a range of questions about wood reliance practices, sustainability, and the overall relevance of forest ecosystems to past cultures and cultural evolution. Newsom provides a step-by-step treatment of archaeological analysis with clear explanations and examples from various corners of the world. She also shows how the study of archaeological wood is relevant to modern restoration ecology and conservation biology that tracks long-term ancient ecosystems, including questions of global change. Demonstrating the vital role of wood and timber resources to past human societies, her book will interest scholars and students of archaeology, historical ecology, paleoecology, and wood science.

Quaternary Vegetation Dynamics of Europe Gerhard Lang, Brigitta Ammann, Karl-Ernst Behre, Willy Tinner. 2023-06-12 Based on palaeoecological studies by many authors, this book gives an overview of the changing history of the European plant cover during the past 2.6 million years, characterized by numerous cold and warm periods. The period of the last 20 000 years (from the Last Glacial Maximum to the present) is presented in detail, with special emphasis on the vegetation dynamics of Europe, the history of selected woody plants, the development of lakes and bogs and the emergence of European cultural landscapes under the influence of humans over thousands of years. In the analysis of the glacial and interglacial periods, the focus is on the different vegetation developments and the progressive impoverishment of the European flora. Further important topics are the spatio-temporal patterns and causes of long-term vegetation changes, the legacies of disturbances and land use on vegetation composition, the role of palaeoecology in nature conservation and its contribution to ecology and environmental sciences. In addition to recent research results, the book provides an overview of the main palaeoecological research methods. It concludes with a summary of the history of palaeoecology and Quaternary botany. For the first time, a detailed synthesis is presented of the many findings on European vegetation dynamics, which are complex and increasingly difficult to

summarize. Numerous figures and tables, many of them original, accompany the text. The bibliography includes over 3000 publications. This book is primarily intended for students, researchers and practitioners in plant ecology, palaeoecology, palaeoclimatology, forestry, agronomy, Quaternary sciences, climate sciences, biogeography, geography and archaeology. *The Arboricultural Journal* .1974

The Plant Stem Fritz H. Schweingruber, Annett Börner. 2018-06-13 This unique and attractive open access textbook combines the beauty of macroscopic pictures of plant stems with the corresponding colorfully stained images of anatomical micro-structures. In contrast to most botanical textbooks, it presents all the stem characteristics as photographs and shows the microscopic reality. The amount of text is reduced to a minimum, and the scientific information is highlighted with short legends and labeled photographs, allowing readers to focus on the pictures to easily understand how the anatomical structures relate to genetic, ecological, decomposition and technical influences. It includes a chapter devoted to simple anatomical preparation techniques, and further chapters showing the cell content, cell walls, meristematic tissues and stem structures of all major taxonomic units and morphological growth forms in various ecological and climatic regions from subarctic to equatorial latitudes, as well as structures of fossil, subfossil and technically altered wood. This textbook appeals to students and researchers in the fields of plant anatomy, taxonomy, ecology, dendrochronology, history, plant pathology, and evolutionary biology as well as to technologists.

Rangeland Systems David D. Briske. 2017-04-12 This book is open access under a CC BY-NC 2.5 license. This book provides an unprecedented synthesis of the current status of scientific and management knowledge regarding global rangelands and the major challenges that confront them. It has been organized around three major themes. The first summarizes the conceptual advances that have occurred in the rangeland profession. The second addresses the implications of these conceptual advances to management and policy. The third assesses several major challenges confronting global rangelands in the 21st century. This book will compliment applied range management textbooks by describing the conceptual foundation on which the rangeland profession is based. It has been written to be accessible to a broad audience, including ecosystem managers, educators, students and policy makers. The content is founded on the collective experience, knowledge and commitment of 80 authors who have worked in rangelands throughout the world.

Their collective contributions indicate that a more comprehensive framework is necessary to address the complex challenges confronting global rangelands. Rangelands represent adaptive social-ecological systems, in which societal values, organizations and capacities are of equal importance to, and interact with, those of ecological processes. A more comprehensive framework for rangeland systems may enable management agencies, and educational, research and policy making organizations to more effectively assess complex problems and develop appropriate solutions.

Atlas of Stem Anatomy in Herbs, Shrubs and Trees Fritz Hans Schweingruber, Annett Börner, Ernst-Detlef Schulze.2011-03-18 This work, published in two volumes, contains descriptions of the wood and bark anatomies of 3000 dicotyledonous plants of 120 families, highlighting the anatomical and phylogenetic diversity of dicotyledonous plants of the Northern Hemisphere. The first volume principally treats families of the Early Angiosperms, Eudicots, Core Eudicots and Rosids, while the second concentrates on the Asterids. Presented in Volume 1 are microsections of the xylem and phloem of herbs, shrubs and trees of 1200 species and 85 families of various life forms of the temperate zone along altitudinal gradients from the lowland at the Mediterranean coast to the alpine zone in Western Europe. The global perspective of the findings is underlined by the analysis of 500 species from the Caucasus, the Rocky Mountains and Andes, the subtropical zone on the Canary

Islands, the arid zones in the Sahara, in Eurasia, Arabia and Southwest North America, and the boreal and arctic zones in Eurasia and Canada. The presence of annual rings in all life forms demonstrates that herbs and dwarf shrubs are an excellent tool for the reconstruction of annual biomass production and the interannual dynamic of plant associations. The common principle of the anatomical expression of secondary growth is a key factor in understanding evolution and adaptation processes in all life forms, from the 2 cm tall whitlow grass (*Draba arctica*) in the arctic to the 40 m tall beech (*Fagus sylvatica*) in Central European managed forests. The study opens vast fields of research for dendrochronology, wood anatomy, taxonomy and ecology.

Anatomic Atlas of Aquatic and Wetland Plant Stems Fritz H. Schweingruber, Andrea Kučerová, Lubomír Adamec, Jiří Doležal. 2020-02-13 This book presents light microscopic anatomical images of aquatic and wetland plant stem. It features double-stained cross- and longitudinal sections of almost 400 species of vascular plants from the lowland to the alpine zone in Central Europe, including plants from lakes, ponds, rivers, bogs, fens, wet meadows, saline meadows, tall herb associations and alpine snow beds. The microscopic photographs at various magnifications are supplemented with detailed anatomical descriptions. For each species it provides a photo of the whole plant, a short morphological and ecological description as well as indications about its world- and Central European distribution. The book includes a hydrobotanical and an anatomical section. The hydrobotanical section describes the ecological classification of aquatic and wetland plants and explains major ecophysiological processes e.g., photosynthesis, mineral nutrition, gas exchange, adaptations to soil anoxia, turion formation and ecology. The anatomical section highlights the variety of structures and anatomical features of vascular plants in all wet environments.

Plant Microtechniques and Protocols Edward Chee Tak Yeung, Claudio Stasolla, Michael John Sumner, Bing Quan Huang. 2015-09-19 A proper understanding of the structural organization of the plant body is essential to any study in plant biology. Experimental studies *in vivo* and *in situ* will lead to structural, physiological, and cellular changes of the experimental material. To study macroscopic and microscopic changes, different histological methods and microtechniques can be used as they provide valuable information of the experimental system. In addition, the observed structural changes allow investigators to set hypothesis for further studies based on one's own observation. Thus, proper selection and utilization of microtechniques are a must for the success of a research program. At present, an up-to-date collection of protocols are not readily available in the literature. The latest work in plant microtechniques was published in 1999 by Ruzin but many others are no longer in print [e.g., Jensen (1964); O'Brien and McCully (1981)]. Furthermore, a majority of published works focus on techniques related to general processing and staining procedures. A comprehensive treatment that encompasses broader applications of microtechniques to other disciplines is lacking [e.g., archeology, wood science, etc.]. There is a need to create a comprehensive volume of botanical methods and protocols which includes traditional and novel techniques that can be used by researchers in plant science and investigators in other disciplines that require plant microtechniques in their research and teaching. This book covers a wide variety of applications and brings them up-to-date to make them understandable and relevant, especially to students using the methods for the first time. It is our intention to create a useful reference for plant histology and related methods that will serve as a foundation for plant scholars, researchers, and teachers in the plant sciences.

Farmers at the Frontier Kurt J Gron, Lasse Sørensen, Peter Rowley-Conwy. 2020-02-15 All farming in prehistoric Europe ultimately came from elsewhere in one way or another, unlike the growing numbers of primary centers of domestication and agricultural origins worldwide. This fact affects every aspect of our understanding of the start of farming on the continent because it means that ultimately, domesticated plants and animals came from somewhere else, and from someone else. In an area as vast as Europe, the process by which food production becomes the predominant subsistence strategy is of course highly variable, but in a sense the outcome is the same, and has the potential for addressing more large-scale questions regarding agricultural origins. Therefore, a detailed understanding of all aspects of farming in its absolute earliest form in various regions of Europe can potentially provide a new perspective on the mechanisms by which this monumental change comes to human societies and regions. In this volume, we aim to collect various perspectives regarding the earliest farming from across Europe. Methodological approaches, archaeological cultures, and geographic locations in Europe are variable, but all papers engage with the simple question: What was the earliest farming like? This volume opens a conversation about agriculture just after the transition in order to address the role incoming people, technologies, and adaptations have in secondary adoptions. The book starts with an introduction by the editors which will serve to contextualize the theme of the volume. The broad arguments concerning the process of neolithisation are addressed, and the rationale for the volume discussed. Contributions are ordered geographically and chronologically, given the progression of the Neolithic across Europe. The editors conclude the volume with a short commentary paper regarding the theme of the volume.

Stable Isotopes in Tree Rings Rolf T. W. Siegwolf, J. Renée Brooks, John Roden, Matthias Saurer. 2022 This Open Access volume highlights how tree ring stable isotopes have been used to address a range of environmental issues from paleoclimatology to forest management, and anthropogenic impacts on forest growth. It will further evaluate weaknesses and strengths of isotope applications in tree rings. In contrast to older tree ring studies, which predominantly applied a pure statistical approach this book will focus on physiological mechanisms that influence isotopic signals and reflect

environmental impacts. Focusing on connections between physiological responses and drivers of isotope variation will also clarify why environmental impacts are not linearly reflected in isotope ratios and tree ring widths. This volume will be of interest to any researcher and educator who uses tree rings (and other organic matter proxies) to reconstruct paleoclimate as well as to understand contemporary functional processes and anthropogenic influences on native ecosystems. The use of stable isotopes in biogeochemical studies has expanded greatly in recent years, making this volume a valuable resource to a growing and vibrant community of researchers.

The Archaeology of Phrygian Gordion, Royal City of Midas C. Brian Rose.2013-03-16 Some of the most dramatic new discoveries in Asia Minor have been made at Gordion, the Phrygian capital that controlled much of central Asia Minor for close to two centuries. The most famous ruler of the kingdom was Midas, who regularly negotiated with Greeks in the west and Assyrians in the east during his reign. Excavations have been conducted at Gordion over the course of the last 60 years, all under the auspices of the University of Pennsylvania Museum of Archaeology and Anthropology. In spite of the economic and political importance of Gordion and the Phrygians, the site is consistently omitted from courses in Old World archaeology, primarily because Gordion lies too far to the west for many Near Eastern archaeologists, and too far to the east for classical archaeologists. Moreover, there is no book that offers a comprehensive and up-to-date assessment of the material culture of Gordion during the Phrygian period, a gap that will be filled by this volume. The chapters cover all aspects of Gordion's Phrygian settlement topography from the arrival of the Phrygians in the tenth century B.C. through the arrival of Alexander the Great in 333 B.C., focusing on the site's changing topography and the consistently fluctuating interaction between the inhabitants and the landscape. A reexamination of the material culture of Phrygian Gordion is particularly timely, given the dramatic recent changes in the site's chronology, wherein the dates of many discoveries have changed by as much as a century. The authors are among the leading experts in Near Eastern archaeology, historic preservation, paleobotany, and ancient furniture, and their articles highlight the interdisciplinary nature of the Gordion project. A significant component of the book is a new color phase plan of the site that succinctly presents the topography in diachronic perspective.

Fire Phenomena and the Earth System Claire M. Belcher.2013-04-08 Fire plays a key role in Earth system processes. Wildfires influence the carbon cycle and the nutrient balance of our planet, and may even play a role in regulating the oxygen content of our atmosphere. The evolutionary history of plants has been intimately tied to fire and this in part explains the distribution of our ecosystems and their ability to withstand the effects of natural fires today. *Fire Phenomena and the Earth System* brings together the various subdisciplines within fire science to provide a synthesis of our understanding of the role of wildfire in the Earth system. The book shows how knowledge of fire phenomena and the nature of combustion of natural fuels can be used to understand modern wildfires, interpret fire events in the geological record and to understand the role of fire in a variety of Earth system processes. By bringing together chapters written by leading international researchers from a range of geological, environmental, chemical and engineering disciplines, the book will stimulate the exchange of ideas and knowledge across these subject areas. *Fire Phenomena and the Earth System* provides a truly interdisciplinary guide that can inform us about Earth's past, present and beyond. Readership: Advanced students and researchers across a wide range of earth, environmental and life sciences, including biogeochemistry, paleoclimatology, atmospheric science, palaeontology and paleoecology, combustion science, ecology and forestry.

The Excavation of the Prehistoric Burial Tumulus at Lofkend, Albania Lorenc Bejko, Sarah P.

Morris, John K. Papadopoulos, Lynne A. Schepartz. 2015-12-31 The burial tumulus of Lofkend lies in one of the richest archaeological areas of Albania (ancient Illyria), home to a number of burial tumuli spanning the Bronze and Iron Ages of later prehistory. Some were robbed long ago, others were reused for modern burials; few were excavated under scientific conditions. Modern understanding of the pre- and protohistory of Illyria has largely been shaped by the contents of such burial mounds. What inspired the systematic exploration of Lofkend by UCLA was more than the promise of an unlooted necropolis; it was also a chance to revisit the significance of this tumulus and its fellows for the emergence of urbanism and complexity in ancient Illyria. In addition to artifacts, the recovery of surviving plant remains, bones, and other organic material contribute insights into the environmental and ecological history of the region.

The missing woodland resources Marian Berihuete-Azorín, María Martín Seijo, Oriol López-Bultó, Raquel Piqué. 2022-07-20 Woodlands are a key source of raw materials for many purposes since early Prehistory. Wood, bark, resin, leaves, fibres, fungi, moss, or tubers have been gathered to fulfill almost every human need. That led societies to develop specific technologies to acquire, manage, transform, elaborate, use, and consume these resources. The materials provided by woodlands covered a wide range of necessities such as food, shelter, clothing, or tool production, but they also provided resources employed for waterproofing, dyeing, medicine, and adhesives, among many others. All these technological processes and uses are commonly difficult to identify through the archaeological record. Some materials are exclusively preserved by charring or in anaerobic conditions at very exceptional sites or leave only a very slight trace behind them (e.g., containers). Consequently, they have received far less attention in archaeobotanical studies compared to other kind of plant materials consumed as food or firewood. This book provides an overview of technological uses of plants from the Palaeolithic to the Post-Medieval period. This collection of papers presents different archaeobotanical and archaeological studies dealing with the use of a wide range of woodland resources, most of them among the less visible for archaeology, such as bast, fibres and fungi. These papers present different approaches for their study combining archaeology, archaeobotany and ethnoarchaeology.

Wood Structure and Environment Fritz Hans Schweingruber. 2007-06-15 The primary aim of Wood Structure and Environment is to reveal the hidden ecological richness in stems and roots from trees, shrubs and herbs. The detailed, lucid text will inspire researchers to consider the anatomic microcosm of wood plants and use it as a retrospective source of information, solving problems related to ecophysiology, competition, site conditions, population biology, earth science, wood quality and even human history.

Agricultural Sustainability and Environmental Change at Ancient Gordion John M.

Marston. 2017-07-05 This book publishes the results of 220 botanical samples from the 1993-2002 Gordion excavations directed by Mary Voigt. Together with Naomi Miller's 2010 volume (Gordion Special Studies 5), this book completes the publication of botanical samples from Voigt's excavations. The book aims to reconstruct agricultural decision making using archaeological and paleoenvironmental data from Gordion to describe environmental and agricultural changes at the site. John M. Marston argues that different political and economic systems implemented over time at Gordion resulted in patterns of agricultural decision making that were well adapted to the social

setting of farmers in each period, but that these practices had divergent environmental impacts, with some regimes sponsoring sustainable agricultural practices and others leading to significant environmental change. The implications of this book are twofold: Gordion will now be one of the best published agricultural datasets from the entire Near East and, thus, serve as a valuable comparable dataset for regional synthesis of agricultural and environmental change, and the methods the author developed to reconstruct agricultural change at Gordion serves as tools to engage questions about the relationship between social and environmental change at sites worldwide. Other books address similar themes but none in the Near East address these themes in diachronic perspective such as we have at Gordion. University Museum Monograph, 145

Atlas of Woody Plant Stems Fritz Hans Schweingruber, Annett Börner, Ernst-Detlef

Schulze. 2007-05-16 This atlas gives a unique assemblage of microscopic slides of wood anatomy and of the respective species in nature and demonstrates the reaction of stem anatomy to environments in which plants form woody stems. It provides insight into the evolution of wood, to the variation of wood anatomy in response to climate and disturbances, and it gives an introduction to the methodology used to study wood. Special attention has been given to the unique feature of secondary growth. In color throughout and with more than 700 both beautiful and instructive illustrations, the wide-ranging scientific content of this book makes it both attractive and unique.
